

Sales & Profit Analysis Dashboard (Excel Project)

Project Objective

The objective of this project is to analyze sales and profit performance across different categories, sub-categories, states, customers, and time periods to support data-driven business decisions.

Dataset Overview

The dataset contains sales transaction data from 2021 to 2024, including customer name, category, sub-category, state, order date, sales, and profit. The dataset includes over 2,300 customer records and was used to simulate real-world business analysis.

Data Cleaning & Preparation

Data cleaning was performed in Excel by removing duplicate records, handling blank values, correcting date and number formats, and standardizing category, state, and customer names. This ensured data accuracy and consistency before analysis.

Analysis & Tools Used

Pivot Tables were used for aggregating sales and profit by year, category, sub-category, state, customer, and month. Pivot Charts, slicers, and Excel formulas such as SUM, IF, and basic text functions were used to build an interactive dashboard.

Dashboard Insights

- Technology category contributes the highest profit.
- Sales peak during November and December, showing seasonal trends.
- California and New York are the top-performing states by sales.
- A small group of customers contributes a significant portion of total profit.

Business Impact

This dashboard helps management quickly monitor business performance, identify high-performing products and regions, understand customer profitability, and plan inventory and marketing strategies effectively.

Skills Demonstrated

Microsoft Excel, Data Cleaning, Pivot Tables, Pivot Charts, Dashboard Design, Business Analysis, Analytical Thinking.
